BitTime：A People-Oriented Barter Method

Author: Not Satoshi Nakamoto
Published: 2015-01-25

Located between the Pacific and Atlantic Oceans lies a vast archipelago—the Bit Islands, with a current population of about 6 billion. The islands are rich in resources and almost isolated from the rest of the world. The islanders have always lived a self-sufficient life. Now, let's turn the screen to the Bit Islands and witness its civilization together…

『The Age of Barter』

In the distant beginning of humanity, in the primitive Stone Age, the apes on the island used readily available stone tools to survive across the wilderness. Nature always bargained with the apes; no matter how much manpower and resources were invested, the prey obtained was always uncertain. The apes traded with nature in this inadvertent way. Long trading experience spurred the evolution of wisdom. Gradually, many new survival techniques emerged, and stone tools began to be selected and polished··· New technologies + improved tools greatly increased productivity, and material surplus slowly appeared. Real trade between people emerged—for example, Ape A traded some surplus wild fruits for Stone B's wild chicken… The ancient islanders lived purely and simply through barter.

『The Age of Physical Currency』

As trade became more frequent, seasonal changes, product quality, scarcity and abundance gradually made the islanders realize that barter could no longer flexibly balance trade needs. A third-party intermediary substance was needed to better facilitate trade. Thus, the wise people on the island successively staged various legends: shells, exotic stones, animal teeth... copper, iron, silver, gold and other currencies. Since gold mines on the Bit Islands were not abundant, and mining and smelting gold was not easy, they coincidentally developed the use of rare and durable material—gold—as the general equivalent for measuring products. For example, two dou of apples corresponded to one tael of gold, and two taels of gold corresponded to one mountain chicken. At this time, the Bit Islands had entered the age of physical currency.

『The Age of Physical Standard』

Physical currency went through countless springs and autumns. With the development of humanities, its drawbacks slowly emerged: gold wears out, is inconvenient to carry, and long-term profits lead to gold hoarding... and so on. Therefore, certain families with stable funds successively opened gold vaults (later called: banks). In addition to lending for profit, the gold vaults also custodied gold for the islanders and issued certificate notes to the gold owners. Gold owners could exchange these paper notes for the corresponding gold at any time. The gold vaults' faithful duty won people's trust. Gradually, merchants felt that whether they exchanged the notes sooner or later, it was still the same amount of gold. For more convenient trade, merchants preferred to accept paper notes. For example, two jin of apples bought one gold note, and two gold notes sold one jin of chicken meat…. In this way, paper notes became paper currency. At this point, the Bit Islands entered the gold standard paper currency era.

『The Bretton Woods Era』

Between 1914 and 1945, two consecutive avian flu outbreaks swept the entire island. The disaster caused countless casualties. Many flu-affected families went bankrupt, but one family made a fortune. It was the American family. During the flu period, they successfully manufactured the vaccine—Bretton Woods—and sent experts everywhere to sell it. By the end of the flu, the American family held 75% of the island's gold. From then on, he became the most handsome guy on the island, and therefore his paper currency, the US dollar, became the reluctant choice for reserves in various family banks. Thus began an indirect physical standard era based on a central authority—the Bretton Woods Era. America issued 75% of the island's paper currency, the US dollar, based on its 75% gold holdings. Various families worked hard like oxen and chickens to earn US dollars in exchange for gold. Before long, America's gold vault was almost empty, and a large amount of US dollar notes flooded into the vault and turned into waste paper… Finally, on August 15, 1978, the American family's supposedly extremely handsome patriarch, Mr. Nixon, made a messy decision—stopping the convertibility of the US dollar into gold. From then on, the physical standard era officially ended.

『The Debt Standard Era』

After the collapse of the Bretton Woods system, gold prices soared all the way, becoming unattainably high. The heavily indebted American family remained very handsome. Without gold reserves, in order to use the pile of waste paper in the gold vault, the American family held up the vision of a bright future and auctioned US debt in disguise. If it couldn't be sold, they borrowed from themselves. That is to say, they dared to issue as many dollars as there was debt, and printed as much as they wanted to spend, because the future is beautiful. This virtual logic of turning things around out of thin air was indeed so handsome that it was dazzling. Looking at the chic yet dominant dollar and the ever-expanding US debt, family banks across the island became nervous. To protect their own currency's living space, to strictly maintain the ratio between their currency and the dollar, and to guard against the illusory commoditization of their currency by the dollar… they had no choice but to increase dollar reserves and overprint their own currency. Some simply used the dollar directly. Up to now, the American family has no value collateral and has not sought Mr. Snowden's consent, singing "Tomorrow Will Be Better" while letting the idle people at the Federal Reserve, who do nothing but copy, inflate 18 trillion in virtual currency. One apple-growing family exchanged apples for 5 trillion, another instant noodle seller exchanged for 3 trillion, and other small vendors came one after another with pots and bowls to exchange. Thus formed a debt currency era headed by virtual dollars. There was once a powerful base organization, the European Union, using the soft gold standard euro to resist the virtual virtual. Fortunately, Greek agents took timely action, and the great virtual virtual ultimately won a great victory. In this way, the virtual virtual lived rough yet resiliently. Although there were often some unsatisfactory fluctuations, it was of no avail. After all, there were idle people everywhere, after all, the virtual virtual was inherently virtual, after all, the digital game could be reset and played again after chaos.

『The Bit Network Era』

Bit is just a unit—the only unit used by computers and all electronic components. It is this unit that has been creating advanced civilization, and it is this unit that has connected the people and cultures of the islands from the Pacific to the Atlantic. It is our beautiful Bit Islands today—

Earth, a unique big family full of wisdom. Although you and I are always in different fields, with different values and different mindsets, fortunately, at this moment, we share the same doubts and are looking at each other, pondering, and continuing through this bit unit… And it is in our Bit Network Era that a mysterious figure, Satoshi Nakamoto, promoted a network currency scheme: using sheets of white paper written with peculiar number groups stacked into a ledger book. Whichever account writes the next page's number gets rewarded with some new coins and recorded in the ledger. At the same time, every transaction between accounts is also recorded in the ledger in chronological order. At this point, the ledger has all the monetary functions of currency issuance + account details + issuance volume, etc. As the number of participants increases, the ledger becomes thicker and thicker, the difficulty of calculating the numbers increases, the fixed total amount and deliberate design make the rewards fewer and fewer. This is the Bitcoin that has fascinated the world. In order to obtain more coins, people mobilized countless computers to calculate the numbers, making the difficulty greater and greater, which is metaphorically called mining. Various speculators flocked in, causing the coin value to soar. In just a few years since its issuance, the value of Bitcoin has risen hundreds of thousands of times when calculated against a pizza meal voucher. The mysterious author positioned the software as an open-source project, so in this simple copy-and-paste era, thousands of altcoins were successively copied and printed, creating a boring computing-power-standard network currency era.

At this point, we can't help but ask ourselves: which one is the real currency after all? Why does it keep changing?? Perhaps it is only to adapt to the constantly expanding trade demand, or perhaps it is the problems of these currencies themselves...... In order to seek a perfect trade system, we try to use bit computers to advance time forward by 20 years and use existing data to calculate the trade state of the Earth in 20 years........ Now the screen comes to a certain day in 2035........

The Earth is all sea. The Maya prophecy was twenty years late. The crustal changes that occurred in 2032 turned the Bit Islands into the Bit Island with only a few Himalayan mountain peaks left. Three years earlier, people had already moved to Mars or the Moon to settle. Only about 7,000 stubborn residents who refused to move remained on the island, along with many monkeys and other animals that had fled there.

It is said that on this day, a merchant from Mars Wall Street came to the island with his assistant and some mochi (cut cake). When the islanders heard about the legendary super circulating currency of the universe—cut cake—they all ran out to watch. The merchant first understood the island's trade situation. After the earth-shaking changes, the Bit Island had retreated to a physical gold and silver currency state. The merchant then proposed to buy some monkeys to take back as pets, offering 1 carat of cut cake per monkey. The islanders didn't know if it was true or false, so they tried catching monkeys. The merchant indeed gave cut cake. The islanders were overjoyed, and soon everyone on the island rushed to catch monkeys. Quickly, the merchant bought more than two thousand monkeys, and there were very few monkeys left on the mountain. At this time, the merchant offered 2 carats each. Seeing the monkey price double, the islanders worked even harder to catch them. The merchant bought more, but monkeys had become very difficult to catch. The merchant then offered 3 carats each. Monkeys were almost impossible to catch. The merchant raised the price to 5 carats each. There were no more monkeys on the mountain. More than three thousand monkeys were now with the merchant. That day, the merchant had urgent business and had to go back. His assistant said to the islanders: "I will sell the monkeys to you at 3 carats each. When the merchant returns, you can sell them to him at 5 carats each, and you will make a fortune." So the islanders went crazy. They turned over all their cut cake, gold, silver, jewelry and ornaments… and bought all three thousand monkeys back. Later, the assistant secretly left, and the merchant never returned. The islanders waited for a long, long time. The monkeys needed care and food, which cost a lot. In helplessness, they had to release the monkeys. There are still monkeys everywhere on the mountain, but the island's gold, silver and jewelry have all been swept away by the Wall Street storm, turning into a 『**new new Stone Age**』 with no currency.

Thus, day after day passed……

One day, a rich second-generation from the Moon came to the island with his girlfriend to fish. After messing around for a long time with no harvest, they got bored and walked to a hotel on the island to open a hourly room for rest. The rich second-generation took out a 1000-carat cut cake note and placed it on the counter, saying he wanted to personally select the room. While the rich second-generation and his girlfriend went upstairs, the shop owner took this heavy 1000-carat cut cake and ran to the neighboring butcher to pay off his pork debt.

The butcher, now with 1000 carats, crossed the street to pay off the pig farmer's pig money.

The pig farmer took the 1000 carats and went out to settle the feed money he owed.

The feed supplier, holding the 1000 carats, hurried to pay his water and electricity bills.

…………

In fact, at this time, everyone on the island was already heavily in debt and lived on credit accounting.

Just as the rich second-generation was coming downstairs, the hair salon proprietress rushed to the hotel with 1000 carats to pay the room fee she owed. The shop owner quickly placed this 1000-carat cut cake back on the counter. The rich second-generation walked to the counter with a complaining tone, saying there was no satisfactory room, picked up this 1000-carat cut cake and left. On this day, no one gained anything, and no one lost anything, but all the island's debts were cleared. Everyone was very happy.

Through this time journey, we witnessed the end of future currency and also saw the birth of a "new new Stone Age." However, the perfect trade system we sought was not found, yet it seems we may have found a method or inspiration….. Now let's first return our screen to today, this moment, this minute, this second….. Discussion begins.

After exploring tens of thousands of years of human civilization, the following conclusions have been drawn:

Conclusion 1. Barter Age: No currency— inflexible and unbalanced

Conclusion 2. Physical Currency Age: Directly causes currency hoarding

Conclusion 3. Physical Standard Age: Indirectly creates currency hoarding

Conclusion 4. Bretton Woods Era: Indirectly causes inflation due to hoarding

Conclusion 5. Debt Standard Era: Infinite debt currency hoarding

Conclusion 6. Bit Network Era: Deliberately contrived necessary hoarding

Conclusion 7. New New Stone Age:

①Mars Wall Street —Currency will ultimately only hoard somewhere

②Moon Rich Second-Generation —Using currency as a unit of measurement to hoard credit

Only Conclusion 1 is an era without currency. Upon closer observation, we find that in conclusions 2,3,4,5,6,7 with currency, hoarding always exists. This leads to a new proposition—Currency = Hoarding.
Interpreting currency characteristics and corresponding commodities:
① Rarity {one tael of silver vs. one ton of rare earth}
② Durability {one gold coin vs. one diamond}
③ Universality {one silver note vs. one bag of grain}
④ Deflation {one US dollar vs. one cart of apples}
⑤ Inflation {a pile of US dollars vs. one hamburger}
It can be seen that the essence of currency is commodity, and commodity is hoarding. Wall Street can arbitrarily assign value to any substance, and their ultimate goal is also to hoard all currency… The worse side is that currency hoarding indirectly derives {money shortage, gambling, deception, extortion, corruption, power-sex transactions, crime, drugs, war, disowning relatives, human trafficking, organ theft…}

…………

At this point, we elevate all the above propositions once again~~ and arrive at the final conclusion:
{**There is no substance in the universe that can serve as currency for trade in the long term**}

…………

『The People-Centered Barter Age』

Is there a way to perfectly carry our trade? The answer is yes! The barter age is the only era we have experienced without currency. Now we can use currency (US dollar) as a unit of measurement to balance the value of both sides in barter (as in Conclusion 7.2), and then use a bit network ledger to record the circulation and disappearance of each exchanged commodity (directly monetizing the commodity), ultimately forming a distributed, decentralized barter system. The core is as follows:

First, for humanity, everything in the universe is a commodity (including you, me, her, tangible and intangible, known and unknown, abstract concepts.. all belong to commodities). Each of us is the ontology that defines the value and term (shelf life) of commodities, and the value of commodities will disappear with their term. Borrowing John Locke's idea: "Everything belongs to nature; we are only followers of a certain period in history."

Therefore, in the bit network ledger, every commodity is a time hourglass. Stacked together, they form the asset value of all humanity (participants). Every barter creates new value (using old assets to create new value). The new value will be evenly distributed to everyone on the ledger, and each person's assets will fade with the passage of time (commodity disappearance). In this way, continuous creation and continuous disappearance repeat day after day, forming an unalterable bit stream timeline————————No currency inflation or deflation, no interest rates, no long-term hoarding… and it can even reduce the darkest and worst aspects of today's world to the lowest… lowest……

This is 《**Bit Time: A People-Centered Barter Scheme**》
